

Microscopes on World Microscope Day 2023

The tool that helps us investigate
The tiny things we cannot see
And learn about their mystery

Microscopes are lenses that magnify
The objects that are too small to spy
They help us see the cells and germs
And study their shapes and terms (*turns)

We can learn about the human body
And how it works in harmony
We can see the bacteria and viruses
And learn how they affect us

We can study the plants and animals
And learn about their structures and materials
We can see the crystals and atoms
And learn about their properties and patterns

Microscopes are used in many fields
From science to medicine to arts and yields
They help us discover new things every day
And make our world a better place to stay

So, let's celebrate World Microscope Day
And thank the tool that helps us play
With the tiny things that make us wonder
And learn about our world down under!
